

Weill Cornell Medical College

Ex Vivo Model for Lung Cancer Metastasis

Min P. Kim, MD, FACS
Assistant Professor
Weill Cornell Medical College
The Methodist Hospital
May 3, 2013

Objective

- Lung Cancer in Patients
- Mechanism behind metastasis
- *Ex Vivo* Lung Cancer Model

Lung Cancer Patient

72 year old gentleman with
60 pack year smoking history
presents with a cough.

Management

Needle biopsy: adenocarcinoma of the lung

Clinical: Stage IA

Treatment:

- Minimally Invasive Right upper lobectomy
- Mediastinal lymph node dissection

Pathology: Stage IA adenocarcinoma of the lung

Survival by Stage

Kassis 2009

6 month later

Image size: 512 x 512

Lung Cancer Patients

- Lung cancer cells form a nodule
- Blood vessels bring nutrients to the lung cancer nodule
- The nodule grows over time at the primary site
- Lung cancer spread to distant organs
- Metastatic disease lead to organ dysfunction and death

Hypothesis

- Epithelial to Mesenchymal Transition (EMT)
 - Tumor cells in a nodule break cell-cell and cell-matrix interaction and enter the circulation
- Mesenchymal to Epithelial Transition (MET)
 - Tumor cell in circulation enter the distal organ and form tumor

Normal epithelium

Basement membrane

Dysplasia/adenoma

Carcinoma in situ

Extravasation

Lymph/blood vessel

Micrometastasis

Macrometastasis

Intravasation

EMT

Invasive carcinoma

EMT

Nature Reviews | Cancer

Currently there is no *in vitro* or *ex vivo* model that can isolate the tumor cells at different phases of growth and metastasis

Modeling Human Lung Cancer

1. Lung cancer cells form a nodule
2. Lung cancer nodule grow in size over time
3. Lung cancer nodule can be perfused with nutrients and oxygen
4. Lung cancer cells escape the nodule through lymphatics or vascular circulation
5. Lung cancer cells in circulation grow in distant site

Conclusion

- Ex Vivo 4D model may mimic the biology of lung cancer growth and metastasis occurring in patients with lung cancer.
- These models may provide better understanding of biology of tumor spread and potentially provide targets for novel treatment of lung cancer metastasis.
